Packing Your Rocketman Parabolic Parachute

1. Just before your flight, raise your Rocketman parachute in the air, making sure all 4 lines are straight and that the loop is on the top of the parachute. Lay the parachute out on the ground, and make sure every connection/quick link are securely tight to the parachute and shock cords.

2. After the lines are straight, pull the parachute flat, and then fold it in half, this will make all 4 lines go into one nice orderly group.

3. The next step is to fold both sides into the middle tightly, this will make the parachute much easier to slide into your rocket. You may have to change how much the sides go in, depending on the diameter of your rocket.

4. Continue by folding the parachute in half again than zig zagging the main lines back and forth, onto the parachute.

5. Once again, fold your parachute in half, this is your last fold, the loop at the top of the parachute should be seen. There's 3 different ways you can continue, depending on your situation, if you're using a deployment bag, flame shield, or "dog barf".

6a. One of the safest ways of deploying a parachute, is by using a Deployment Bag.

6b. The next step is to slide the parachute into the deployment bag, and then fold the flap over the bag.

6c. The parachute is now ready to be installed into the rocket, flap facing downwards.

7a. The second way to pack a parachute is by using a Flame Shield, Start off by attaching the parachute to the flame shield, and then placing the parachute to one side of it

7b. The next step is to start burrito wrapping the parachute, by rolling the flame shield.

7c. The last step of folding is to fold in the sides tightly.

7d. Lastly, slide the flame shield/parachute, into your rocket as normal.

8. The third way to continue is by sliding the parachute into the rocket, and use dog barf (cucluse) to protect your parachute.

9. Launch your rocket!
